

■ UPS Systems

Safety can be embedded!
IUPS-401 – UPS embedded...

Do you still protect your data according to the principle „What could possibly happen“?
Provide your data with the security they deserve!

Power FAILURE.

...are your data really safe now? No?!
Then provide your data with a UPS.

What is a UPS and what do I need it for?

UPS stands for **U**ninterruptible **P**ower **S**upply.

Power failures occur all the time – even if only for a few seconds. But already now important data can be lost or operating systems and hardware can be damaged. Often this means financial losses, in the worst case due to machine downtime.

This can be avoided! **The IUPS-401 (embedded UPS) protects computers against power failures.**

A IUPS-401 allows the computer to operate without power and there is time to perform a controlled system shutdown.

Why an embedded UPS?

Simply because it is the most comfortable solution for a computer! Forget about space problems or tripping over cables. Compared to conventional UPSs, the IUPS-401 (Internal **U**ninterruptible **P**ower **S**upply) is very small and compact. **Due to this compact design it can be installed in a 5 1/4" drive slot without any problems. Thus computer and UPS form one unit.**

Why complicate things?

...If there is a
more elegant solution!

The IUPS-401: Your benefits at a glance

- Maximum protection of hardware and Software in case of power failure
- Fits snugly in a 5 1/4" drive slot of a computer case
- No additional space required for standard device thanks to easy integration
- Exchangeable front panel for light coloured and black cases
- 400 VA performance
- Load sensor and reboot function
- USB interface & UPS management software
- Easy handling
- Less cable tangles
- Low power consumption
- Many satisfied customers
- Bargain price
